

S-Pol Refractivity Applications: Some Preliminary SoWMEX/TiMREX Observations

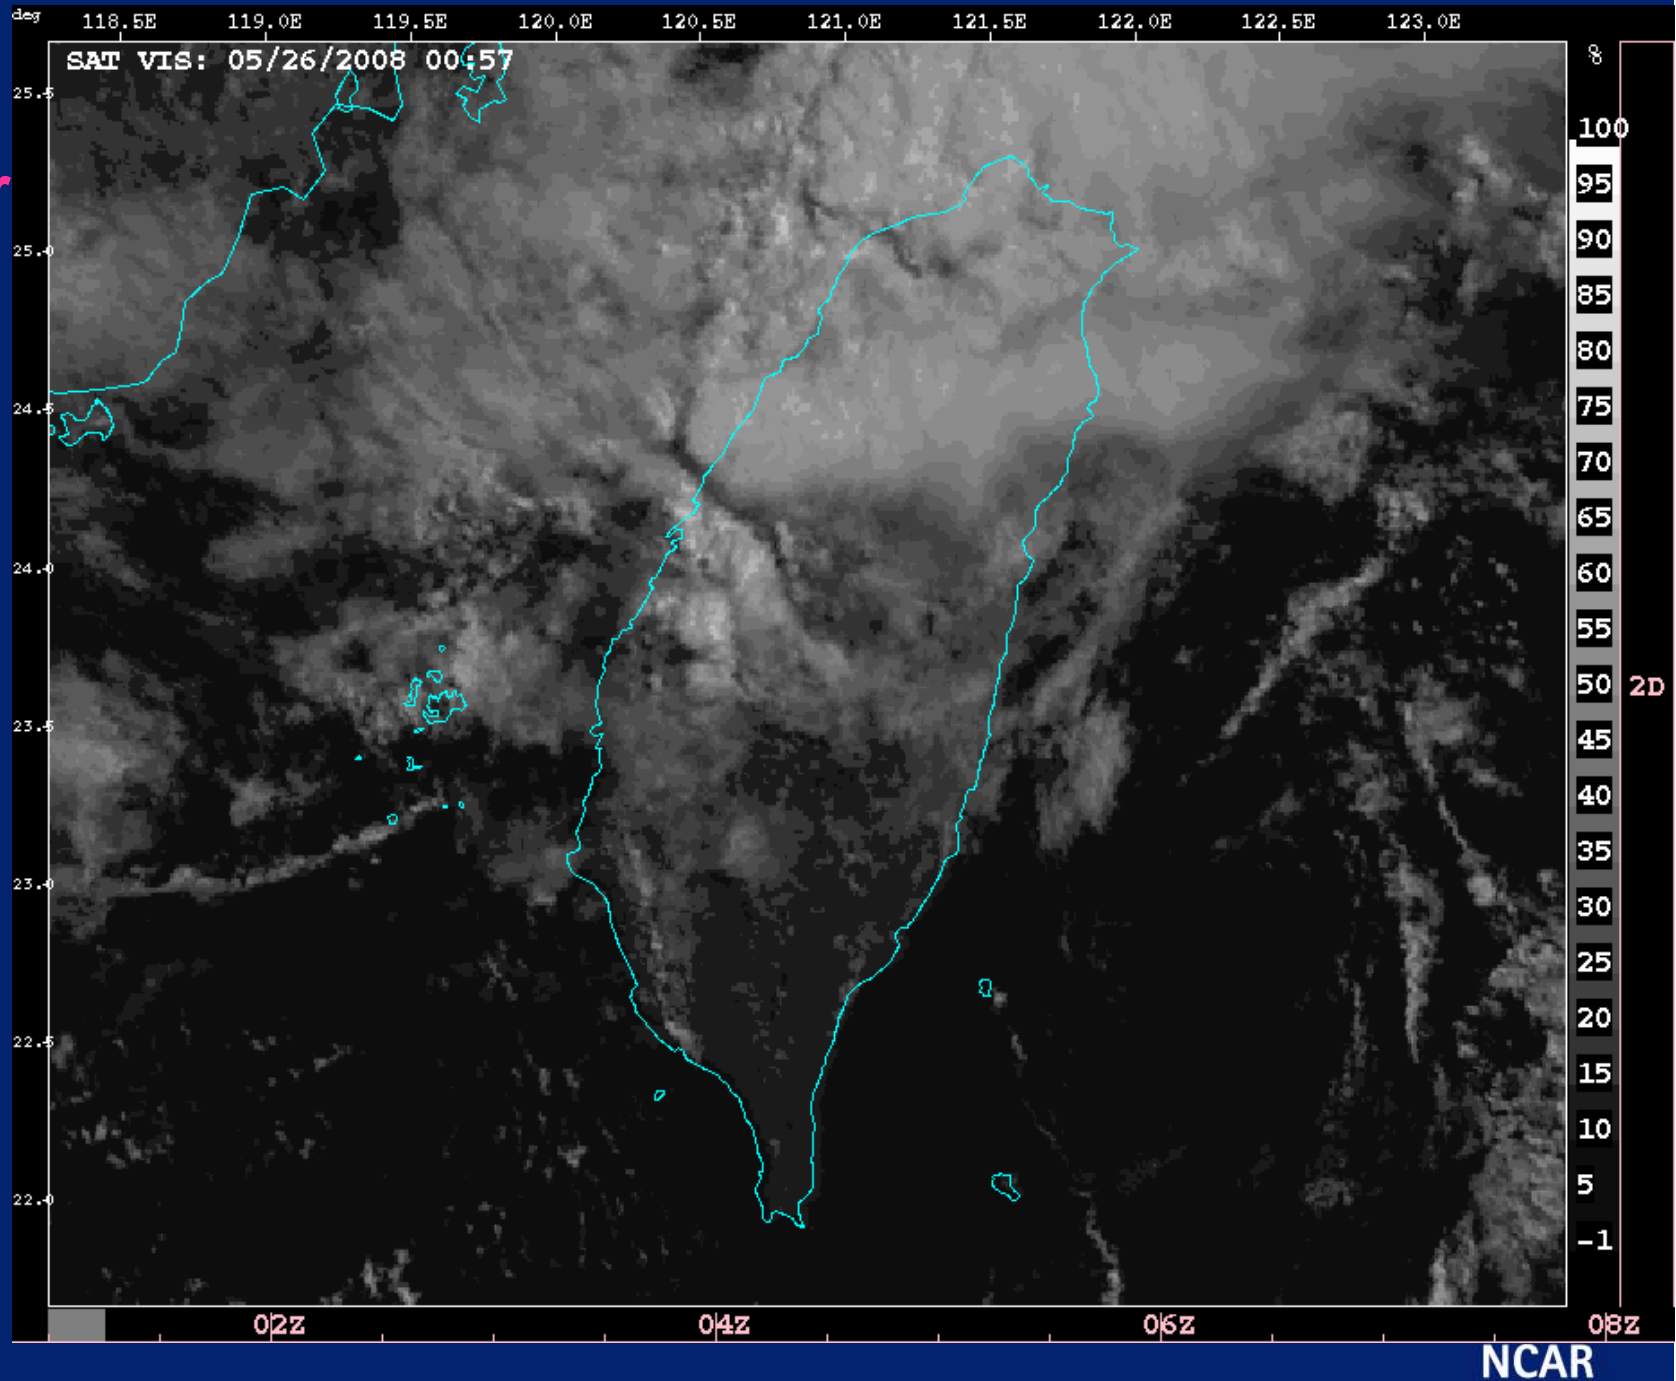

Tammy M. Weckwerth, NCAR and Ya-Chien Feng, NCU

With many thanks to Frédéric Fabry (McGill), Scott Ellis (NCAR), Rita Roberts (NCAR), Jason Fritz (CSU), Eric Nelson (NCAR) and Tai-Chi Chen Wang (NCU)

26 May 2008

- Mostly clear in S. Taiwan in morning
- SBF with convection develops at 0130 UTC
- Enhanced convection in mountains by 05 UTC

• **CBL growth:**
warming and
drying

• **Moist**
throughout
sounding

• **Midlevel**
inversion at 00
and 03 UTC

• **CAPE/CIN (J/kg)**
125/-197 (00 UTC)
201/-37 (03 UTC)
298/-54 (06 UTC)

• **SBF passed**
Pingdong
between 00 and
03 UTC sondes

WINDS PROFILE

One barb = 10.0 m/s

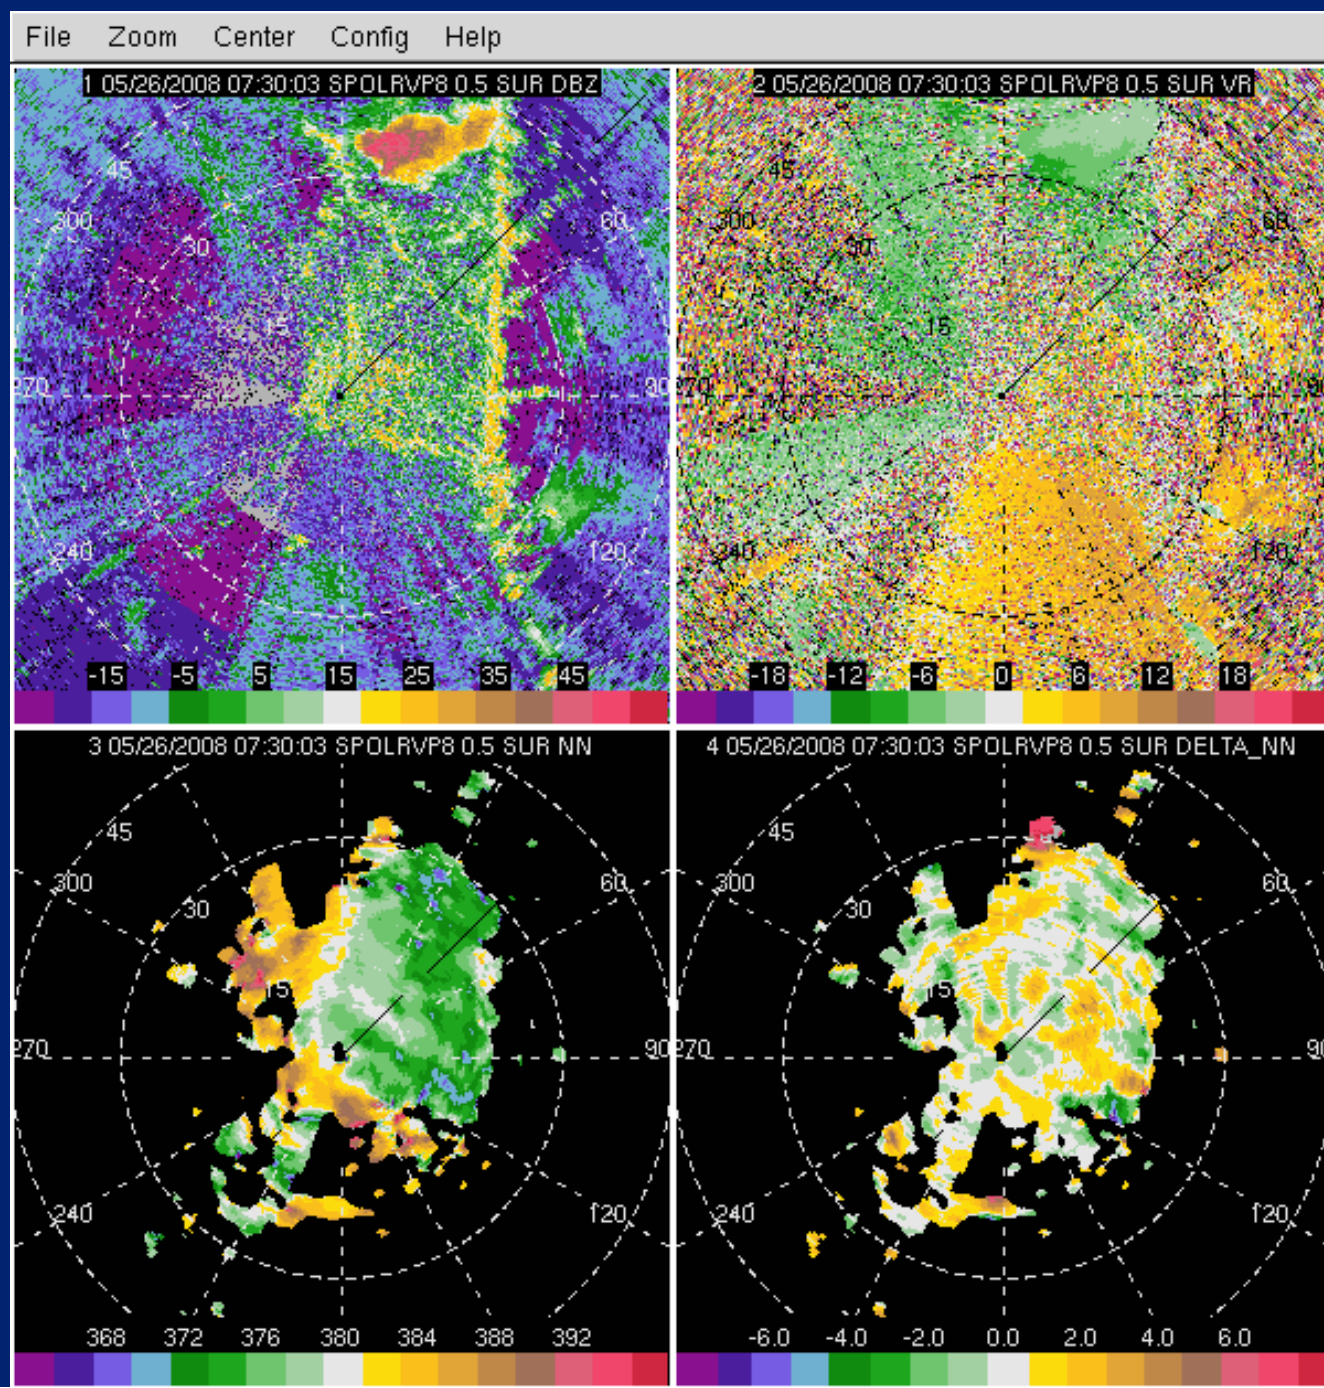

26
May
2008

- Consistent PW throughout the day
- Moisture in foothills after SBF passage (0145 UTC)

26 May 2008

- SBF 01-03 UTC
- Increase in N behind SBF; Delta N signature
- CI: 0142 & 0242 UTC
- CI in high N regions near N gradients
- Gust front after 07 UTC has brief N and Delta_N signature
- Significant structures and variability in N

28 May 2008

- Convection first intensifies and then dissipates as it reaches the mountains

• CBL growth more gradual due to cloud cover: warming and drying

• Moist to 700 mb

• Midlevel inversion at 00 and 06 UTC

• CAPE/CIN (J/kg)
N/A (00 UTC)
33/-148 (03 UTC)
82/-112 (06 UTC)

• Weak SBF passed Pingdong between 00 and 03 UTC

WINDS PROFILE

One barb = 10.0 m/s

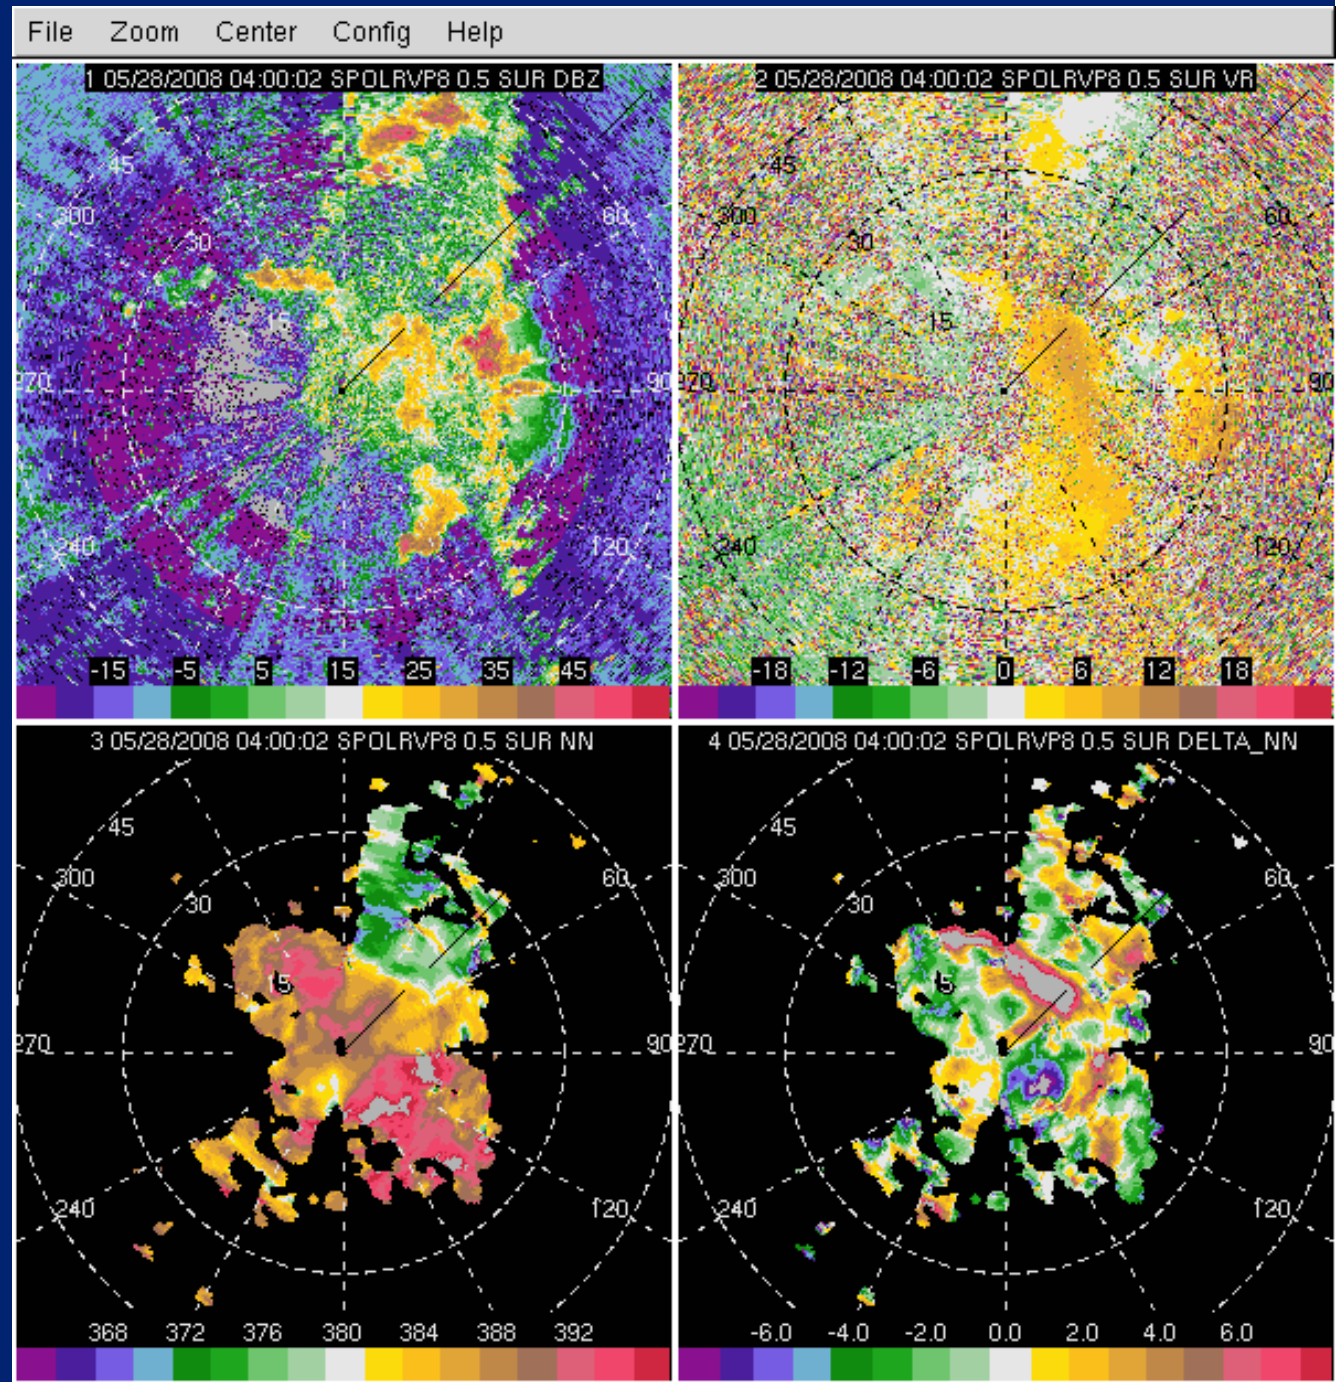

**28
May
2008**

- Moistening along coast
- Drying in Foothills until 0445 UTC

28 May 2008

- Convection dissipates as it moves into low N region
- CI @ 0315 UTC in advance of approaching squall line develops on high N and persistent Delta N region
- Convection tends to intensify (dissipate) as it moves into high (low) N regions

30 May 2008

- Convection moves onshore and intensifies

30 May 2008

- CBL growth: warming and drying
- Moist to 600 mb
- CAPE/CIN (J/kg)
277/-41 (00 UTC)
302/-19 (03 UTC)
356/-19 (06 UTC)
- Weak SBF passage between 00 and 03 UTC

WINDS PROFILE
One barb = 10.0 m/s

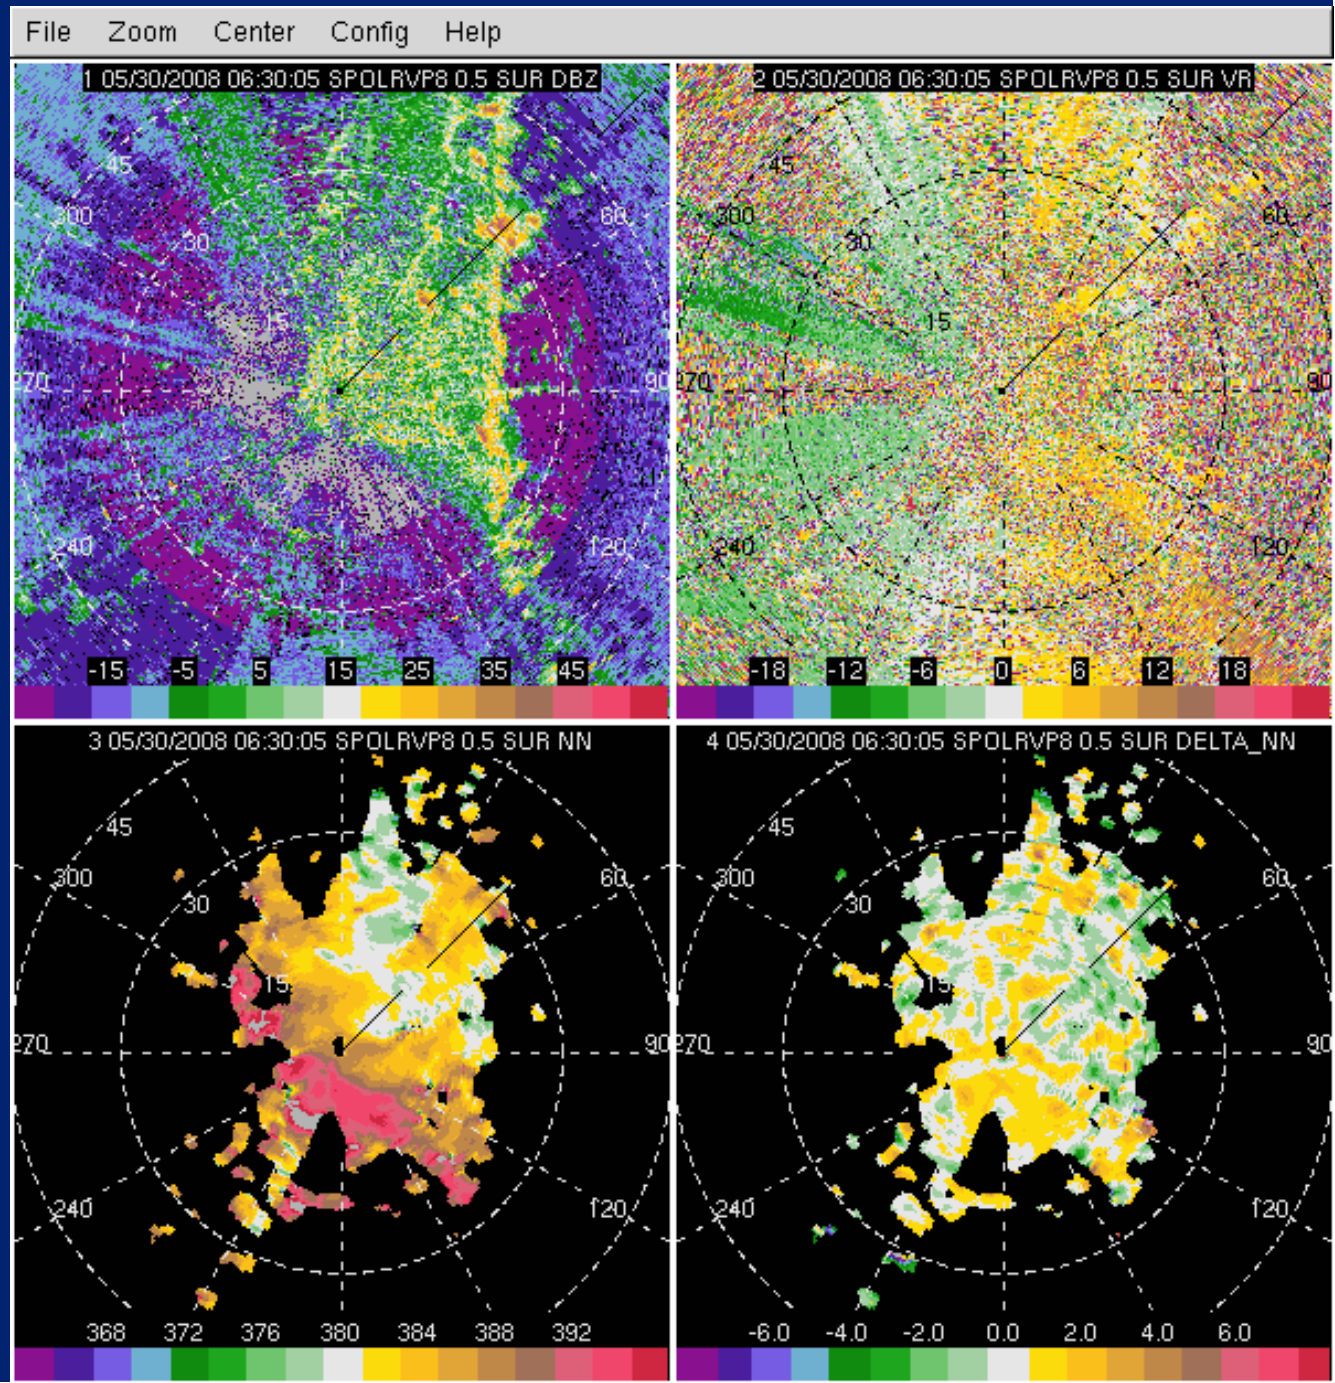

30
May
2008

• Slight
moistening,
consistent
with
soundings

30 May 2008

- CI in moist air
- 0430: dry region moving onshore with decrease in convection; fine line forms later
- 06: CI in high N (moist) region near foothills
- N is useful to monitor spatial and temporal variations in low-level moisture/temperature

14 June 2008

- IOP case: widespread precipitation
- CBL growth: cooling and moistening
- Surface inversion
- Deep moisture
- CAPE/CIN (J/kg)
62/-84 (00 UTC)
145/-59 (03 UTC)
59/-57 (06 UTC)
- no SBF

Potential Refractivity Applications

- Nowcasting CI (CI in max N regions)
- Monitoring low-level spatial and temporal moisture/temperature variations
- Monitoring SBF and sometimes gust fronts
- Widespread precipitation: N as precursor to further development or dissipation

We invite you to consider if refractivity may be useful for your SoWMEX/TiMREX research
